

***** **PRESS RELEASE from C. Otto Gehrckens** ***

COG's new technology centre: Space for innovation

The seal expert C. Otto Gehrckens has put its new technology centre into operation, directly on the company's site in Pinneberg, near Hamburg, therefore decisively expanding its manufacturing expertise in the truest sense of the word. Across an overall area of 2,000m², this is where the specialists at COG are developing new materials to meet industry's challenges of tomorrow. The extensive, modern equipment in the technology centre makes it possible to simulate all stages of production and at the same time to replicate the various production processes. This represents the analytical foundation for profound optimisation and new development of not only materials but also complete production processes. With the new technology centre, COG now has at its disposal greater means and capacity to advance the company's broad portfolio in a focused manner and so that process reliability is guaranteed.

A consistent, future-orientated and customer-orientated range is what made the company an internationally renowned manufacturer of elastomer seals. The new technology centre, with its wide-ranging opportunities for product development and technological innovation, is a further step into the future. COG therefore remains a dependable, strong partner in today's demanding seal technology sector.
